TITLE: Methodology of Establishing Estimated Water Levels and
Principal Dimensions in Navigable Internal Waterway
Canals (Metodika ustyanovleniya raschetnykh urovney
vody i glavneyshikh razmerov sudokhodnykh kanalov
vnutrennikh vodnykh putey)

PERIODICAL: Tr. Tsentr. n.-i. in-ta ekonom. i ekspluat. vodn.
transp., 1955, Nr 5, pp. 5-88

ABSTRACT: Chap. I deals with the estimation of the statistically
highest and lowest water levels in navigable canals for
1) canals locked at both ends and 2) canals opening into
rivers or reservoirs. The methods of estimating water
losses by filtration and evaporation, the determination
of dynamic levels caused by sharp changes in water dis-
charge, by wind- or ship-created waves, or by other
phenomena, the order in which dynamic levels are

Card 1/2

Methodology of Establishing Estimated Water Levels and Principal Dimensions in Navigable Internal Waterway Canals (Cont.)

14-1-801

determined are indicated and winter water levels and ice conditions examined. Chap. II deals with incline reinforcement boundary lines, the determination of the height of ship created waves and the height of their roll onto the canal's incline, the increase of the height and lowering of the depth of reinforcements in relation to estimated water levels and the estimation of levels in determining the boundaries of stone reinforcements of inclines and reserve reinforcements in relation to such levels. Chap. III deals with the determination of minimum canal cross section areas.

Radiolokatsiya; uchebnoye posobiye dlya soldat i serzhantov (Radar; Textbook for Privates and Sergeants). Moscow, Voen. izd-vo M-va obor. SSSR, 1960. 442 p. No. of copies printed not given.

Ed.: V. T. Vladimirov, Engineer-Colonel; Tech. Ed.: A. N. Mednikova.

PURPOSE: This textbook is intended for technical training of privates and non-commissioned officers. It is also available to the general reader who is sufficiently acquainted with the fundamentals of electrical and radio engineering.

COVERAGE: The book describes in elementary form the fundamentals of radar, and gives basic information on pulse technique. Principal methods of determining target coordinates are given at the end of the book. Chapters VI, VIII, and IX were written by A. V. Vrublevskiy. There are no references.

Radio - Exhibitions

Feb 21

"Tbilisi Radio Exhibition," S. Matlin

"Radio" No 2, p 11

Best exhibit in section on introduction of radio methods in the economy was Parfenov's tachometer. Portable radio-phonograph designed by Byranov was best exhibit in receiving equipment section. A 2-tube (UB-240's) ultrashort-wave transceiver designed by Zemerniy won special mention in ultrashort-wave equipment section. Few exhibits were shown, which was attributed to the poor work of the Tbilisi radio club.

2. Technical Equipment for Grading Competitive Work

3. Date: No. 5, 54 - 56, May 1954

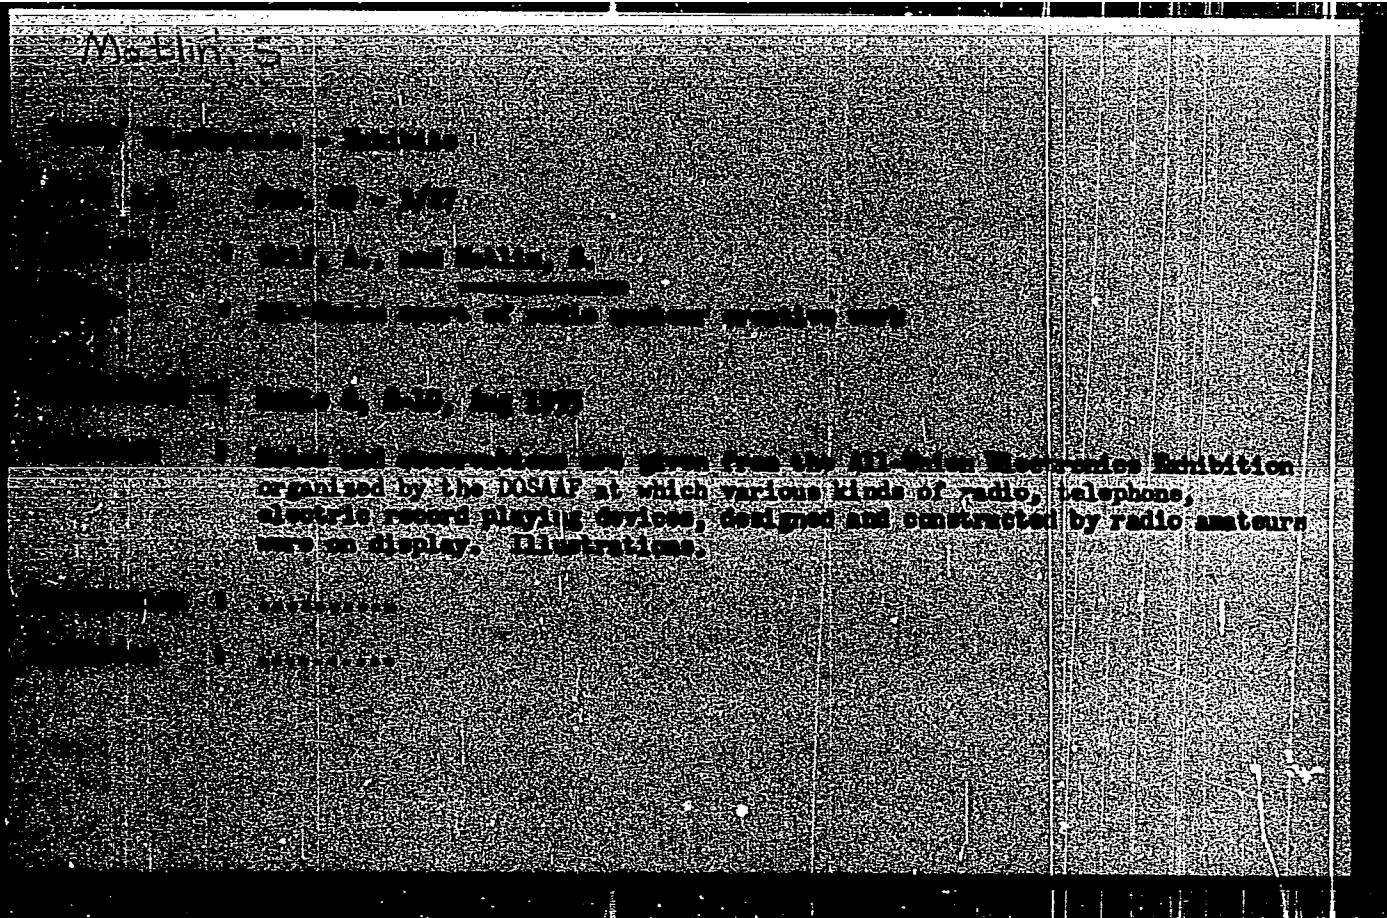

4. Description: The article discusses several devices used for grading the work of radio-telegraph operators, taking part in competitions for quality and speed of performance. The article describes in greater detail a device consisting of an "oscillator", an amplifier-recorder, connected with the oscillator, and two methods of their operation. Circuit diagrams of the oscillator and of the amplifier are given. Reference is also made to a "recorder", representing a photographic recorder with a film, used for the same purpose of grading competitive work. A schematic diagram, showing the method of installation of the instruments and their arrangement in the competition room, is also given.

TITLE: Remodeling of the A7A Radio Station for 38-40 mc
(Peredelka radiostantsii A7A na 38-40 mggts)

PERIODICAL: Radio, 1956, Nr5, p.32, (USSR)

ABSTRACT: The A7A radio station is actually a transceiver with a 7-tube, $1\frac{1}{2}$ μ v-sensitivity receiver, and a 2-stage, FM, narrow-band modulation transmitter. Antenna power about 1 w. Plate circuits are supplied from 2 type 5AC-80 batteries, and filaments circuits from type 2HKh-22 storage battery. The supply pack insures continuous service of the station for 40 hrs.

The necessary changes in circuits are described in detail, and the part of the schematic diagram subject to rewiring is presented.

After remodeling the antenna output should be as high as 120 ma at 40 mc, and the receiver sensitivity should be 2-3 μ v or better in the 38-40 mc band.

One figure in the article.

TITLE: The People's Laboratory (Narodnaya laboratoriya)

PERIODICAL: Znaniye - sila, 1958, Nr 11, p 18 (USSR)

ABSTRACT: Since 1935, fifteen All-Union radio exhibitions have been organized in the USSR. By a resolution of the TSK DOSAAF, the last one, the 15th All-Union Radio Exhibition, took place in August 1958 in Riga. It contained 400 exhibits from 50 Soviet cities and the greater part of them proved that the radio amateurs have developed their technical skill and ability to solve the complicated problems of modern radio-engineering and electronics. The number of designs using semiconductor devices exceeded by 5 times the number of similar devices at the preceding exhibition. There is 1 photo.

20-6-46/57

TITLE: Adrenalin and Adrenalin-Like Substances Detected in Blood in the Case of a Pain Syndrome (Adrenalin i adrenalinopodobnyye veshchestva v krovi pri bolevom sindrome)

PERIODICAL: Doklady AN SSSR, 1957, Vol. 117, Nr 6, pp. 1085-1088 (USSR)

ABSTRACT: The assumption was several times expressed that the feeling of pain develops due to the occurrence and the accumulation of special chemical substances in the tissue, as these substances irritate the nerve terminations (references 1,2). Histamine is above all counted among them. From published data and own observations of the first author follows that the level of free histamine in the blood in diseases of the nervous system accompanied by pain syndromes increases. But histamine is not the only chemical substance causing the pain. Most of the authors come to the conclusion that the direct cause of the local pain is oxygen deficiency. This develops due to modifications of the torrent of blood, by disturbance of the tissue-respiration, sinking of the partial pressure of oxygen in the blood and so on. All these processes take place under the control of the central and peripheral parts of the nervous system and are connected with certain displacements in the chemical composition and the biological properties of the blood

Card 1/4

Adrenalin and Adrenalin-Like Substances Detected in Blood in the 20-6-46/67
Case of a Pain Syndrome.

and the tissue-field. As is well-known the feeling of pain is accompanied by an excitation of the sympathetic-adrenal apparatus and by an increased secretion of sympathico-mimetic substances. The problem of the chemical structure of the mediators of the sympathetic series for the most part remains unsolved. Most authors (references 3-5) are of the opinion that the sympathetic reactions in the organism take place under participation of adrenalin and its various transformation products. According to Bakh (reference 3) sympathin I which inhabits the functions is adrenalin, whereas the exciting sympathin E stimulates the functions is noradrenalin. In their studies of the humoral displacements during diseases of the nervous system accompanied by pain syndrome the authors found (refernce 6) that they are also accompanied by a considerable increase in the sympathetic activity of the blood. It was the object of the present work thoroughly to study the metabolism of adrenalin and adrenalin-like substances. After the description of the method employed and of the results the authors come to the following conclusions: In deseases whose leading feature is the pain syndrome the following takes place: 1) the level of total adrenalin in the blood increases, 2) dehydroforms of adrenalin-like sub-

Card 2/4

Adrenalin and Adrenalin-Like Substances Detected in Blood in 20-6-46/47
the Case of a Pain Syndrome.

stances (dehydro-adrenalin and dehydro-chromogens) are more often discovered than in healthy individuals, and the coefficient of specificity increases, 3) an asymmetry of the content of adrenalin-like substances manifest itself; the level of the total adrenalin is increased at the side where the focus of pain lies (the "pain side"), 4) the improvement of the clinical state of patients suffering from pain syndrome is accompanied by a decrease of total adrenalin in the blood. According to Kennon (reference 7) the increased secretion of adrenalin in the case of acute experimental pain is supposed to have a compensatory and protective significance against painful injuries. According to the authors' investigations the relative quantity of reduced adrenalin in the complex of adrenalin-like substances increases in the case of pathological pain; At the same time the chromogens increase; noradrenalin apparently also belongs to them. The above-mentioned conclusions are further interpreted. At the same time (reference 6) earlier papers by the authors showed that the amount of parasympathico-mimetic substances (especially of acetylcholine) in the blood increases in pain syndromes. In treatments of pain syndromes connected with an increase of adrenalin-like substances in the blood (headache of

TITLE: Adrenaline-like Substances and the Biological Activity of Blood in the Case of Cold Essay Under Normal Conditions and Those of Diencephalic Pathology (Adrenalinopodobnyye veshchestva i biologicheskaya aktivnost' krovi pri kholodovoye probe v usloviyakh normy i dientsefal'noy patologii)

PERIODICAL: Doklady Akademii nauk SSSR, 1959, Vol 126, Nr 2, pp 446-449 (USSR)

ABSTRACT: The state of the vegetative nervous system is to a certain extent characterized by the different forms of the adrenaline-like substances. On the other hand it is impossible to gain by only one determination of the chemical composition and the biological properties of blood a conception concerning the "homeostase" boundaries or the structure of the pathological syndrome as the latter is always a combined expression of pathological processes and compensation phenomena. The main principle of the collective group of the authors is a dynamical investigation of the human organism: of a healthy, a sick, and a recovering one. The authors did not restrict themselves to the determination of a physiological or biochemical final

Card 1/4

Adrenaline-like Substances and the Biological Activity of Blood in the Case of Cold Essay Under Normal Conditions and Those of Diencephalic Pathology

constant but tried to find the adaptation mechanisms of the organism and to separate the primary from the secondary reactions which are so important for the origin, course, and result of a disease. The authors used the method of the adrenaline-like substances and of the biological blood activity before and after the stress in order to characterize the reactivity of the nervous system. In the present paper the results are given which were obtained by cooling down the experimental person's hand. Healthy persons (control) and such affected with different forms of diencephalic pathology (Refs 5, 6) served for this purpose. With practically healthy persons the cold essay lead to an increase in the sympathetic blood activity. It was expressed by an increase of the positive inotropic effect on an isolated frog heart (an average of 40-50%). The acetyl-choline level in blood was reduced by an average of 40%. In most cases the content of reversibly reduced adrenaline-like substances and more rarely of the specificity coefficient (SpC) increased. Thus the primary reaction of healthy persons is in the case of a cold stress the activation of the sympathetic adrenal apparatus. The

sick persons can be divided into 4 groups according to the results: Ist group. The reaction does not differ considerably from the normal reaction. Often there occur, however, considerable shifts which surpass the physiological fluctuations of the content of the investigated substances. Mainly persons with functional disturbances of the activity of the regulatory hypothalamus nerves were concerned. The disease is curable in spite of the patients' complaints and shows a favorable course. IIInd group. The sympathetic activity (accumulation of "sympathines") increases here, the adrenaline-like substances increase, sometimes also the SpC in the case of a simultaneous increase in acetyl-chinoline. IIIrd. group. The sympathetic blood activity and the acetyl-chinoline decrease are reduced. An additional heat essay is recommended (Ref 4). IVth group. The sympathetic blood activity is reduced. Reduction of the adrenaline-like substances, sometimes reduction of SpC. Acetyl-chinoline increases (Fig 2). This occurs in severe diencephalic pathology and is scarcely curable. The increase in the sympathetic blood activity can depend on the accumulation of the adrenaline-

like substances, on the transition of the oxidized forms to reduced ones, but also on the reduction of the "parasympathine" level. The increase in "parasympathine" level is often connected with the reduction of the sympathetic activity. There are 1 figure and 7 Soviet references.

Properties of deaminase isolated from myosin. M. N. Zubimova and E. Sh. Matlina. Doklady Akad. Nauk S.S.R. 54, 627-630 (1947); C.A. 41, 112684. The deaminase isolated from myosin (cf. C.A. 40, 112684) shows the following properties. The enzyme is less stable in storage than myosin (10-12 days at 3°); it loses 50% of its activity in 4 hrs. at 37°, but is unaffected under these conditions in the presence of the substrate. The optimum pH for its activity is 6.3. The enzyme contains SH groups being inactivated by AgNO_3 and α -chloromercuribenzoate. It appears to need a low mol. wt. activator, as shown by change in activity after dialysis in the absence of myosin. The activity is restored by addition of boiled centrifuged myosin soln. The activator appears to be org., since the added material of myosin has an even deamino action. Adenosinediphosphate and adenosinetriphosphate show very strong activating effect on the enzyme. The activating agent is not specific for it can be obtained from different sources. Spectral analysis of dialyzates of the enzymic specimens shows that a substance with absorption max. about 360 m μ passes into the external medium and the max. of the fluorescence shifts progressively from 366 to 373 m μ . For prep. of myosin, the use of 0.01M glycine soln. instead of pure H_2O is advised. C. V. Kostyuk
